

Put machine learning to work

Five ways Artificial Intelligence can transform your reconciliation processes.

1

Build reconciliations automatically

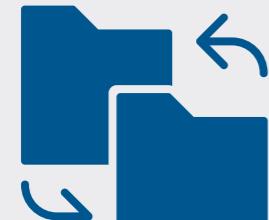

Create and optimize reconciliations with machine learning technologies, using historical data to minimize user interaction, complementing—or even eliminating—legacy processes.

2

Accelerate reconciliation onboarding

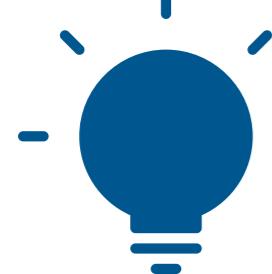

Industry estimates show it could take months to bring new reconciliations online. Use AI to automatically analyze new data and do the same work in just a few hours.

3

Identify and classify matching breaks

Save time and resources when you use AI to eliminate the manual effort required to research and resolve breaks.

4

Improve matching schemes

Machine learning algorithms continuously test, learn, enhance and retest reconciliation models using an iterative learning model, ensuring that the matching scheme always fits your data.

5

Recommend the best exception resolution

Realize even greater efficiency when you let Artificial Intelligence choose the appropriate adjusting entry required to close the break.
